

Summary

Site involves a large, rectangular structure. White, grey, and green are important colors associated with the site, as are stinky smells and metallic, shiny textures. Some sort of processing is going on within the structure. There is a large open area, well-lit, with complex and often rather large assemblages of stainless-steel and other metallic objects and apparatus. The process involves controlling, condensing, containing, filtering, precision, and colors such as green and yellow, and gassy consistencies. Titration, catalysis, retorts, and pressure may also be involved. There are dials and readouts used to monitor the internal states and conditions in the various pieces of equipment. Introducing, combining, adjusting and monitoring are activities involved here. Valves, pipes and tubing connect various assemblages of cylindrical containers (see sketches for detail) which also process. Cool temperatures are necessary in some places and hot temperatures in another. Impressions of people turning wheels or valves to introduce one element into a container of another to obtain synthesis or production of some third substance. It seems to be some sort of new process/technology---a "breakthrough" type of procedure. The site is a subelement of a larger effort/organization which is diversifies geographically and in its activities. People here at the site are excited, enthusiastic, satisfied with what they do, and feel a sense of fulfillment and accomplishment. They feel they are doing something constructive for their society.

In the processing, venturitis, hydrodynamic flow, possibly electromagnetic irradiation, a reagent, a "fusing", and perhaps some sort of implosive all seem to be involved. Pressure is important. Caustic, corrosive, noxious, hazardous substances are involved, requiring safeguards; the figurative idea of "fermenting" plays a role---the sense of aging a substance gradually, changing, maturing, transforming, stabilizing. When the proper precautions are followed the substances can be controlled relatively safely, but direct contact must be avoided. Valves are specially designed to avoid any amount of leakage, accidental discharge or pressure blowouts. A special metal alloy is employed that is dense, steel-based, machined, annealed, and non-conductive. The end product is the most dangerous. Countermeasures for it are difficult to apply, slow acting, and relatively unpredictable, as well as only marginally successful. The substance is actively against hydrocarbon/organic materials. Its consistency is denser than a normal gaseous substance, but less dense than a solid or liquid. The idea of "gelatinous" comes best to mind. The constituent parts are gaseous/vaporous; but the final product is gelatinous. The proposed application of the substance is only theoretical; there has as yet been no occasion to employ it in any practical mode. Its use seems to involved distribution over a wide area out of doors. Presently there is no sense of inimical purpose. ADLs of chemical warfare and, alternatively, a fusion power plant were suggested. At least three substances (see sketch) are used to produce the end product. The first substance is cool, sharp in smell and feel, and produced the German word "Sauerstoff" (oxygen) as a descriptor. The second substance is "benign", "flat", has a

stinging smell, has a neutral temperature, and produced the word "inert" as a descriptor. The final substance is warm, brownish, soupy, caustic, and has a nasty taste; it suggested the AOL of iodine. The end product when contacting organic-based materials causes the material to "curdle" and has the sense of "sloughing off" (AOL of "liquid leprosy").

The people here are neat and tidy, ^{wear} wear ties under white lab coats, and exhibit more of a "hive mentality" than would their American counterparts in a similar situation--they're less individually independent in their efforts. "Team work" by culture rather than individual choice. They are very much a product of their society/culture, and much more uniform in their personalities and response to the world. There is a mild defensiveness or paranoia underlying their social background. They seem to have some sort of oriental feel about them.

There is a large body of water somewhere in the vicinity. AOLs of the east side of the Caspian Sea and "Semipalytinsk" (however it's spelled) closed up the session.
